Rate Volatility

MOVE Index and FOMC Event Risk

As of 2026-05-01

70.4	17.0	4.14x
Current MOVE	Current VIX	MOVE / VIX

The MOVE Index (Merrill Lynch Option Volatility Estimate) measures implied volatility in the US Treasury market via 1-month options on 2Y, 5Y, 10Y and 30Y Treasuries. It is the rates-market analogue of the VIX — a fear gauge for bonds. Readings below 80 signal calm; 100–120 reflects moderate uncertainty; above 150 indicates acute stress. FOMC decisions are the dominant driver: vol typically elevates in the days before a meeting (uncertainty premium) and collapses after (resolution of event risk). Tracking the MOVE/VIX ratio reveals whether rate or equity vol is in the driving seat.
